Climate change - State needs 'unrealistic' number of EV stations

California will have to build public charging stations at an unprecedented — and some experts say unrealistic — pace to meet the needs of the 7 million electric cars expected on its roads in less than seven years.

The sheer scale of the buildout has alarmed many experts and lawmakers, who fear that the state won't be prepared as Californians purchase more electric cars.

A million public chargers are needed in California by the end of 2030, according to the state's projections — almost 10 times more than the number available to drivers in December. To meet that target, 129,000 new stations — more than seven times the current pace — must be built every year for the

next seven years. Then the pace would have to accelerate again to reach a target of 2.1 million chargers in 2035.

A robust network of public chargers — akin to the state's more than 8,000 gas stations — is essential to ensure that drivers will have the confidence to purchase electric vehicles over the next several years.

"It is very unlikely that we will hit our goals, and to be completely frank, the EV goals are a noble aspiration, but unrealistic," said Stanford professor Bruce Cain, who co-authored a policy briefing detailing California's electric vehicle charging problems. "This is a wakeup call that we address potential institutional and policy obstacles more seriously before we commit blindly."

Under California's landmark electric car mandate, a pillar of Gov. Gavin Newsom's climate change agenda, 68% of all new 2030 model cars sold in the state must be zero emissions, increasing to 100% for 2035, when 15 million electric cars are expected in California.

"We're going to look really silly if we are telling people that they can only buy electric vehicles, and we don't have the charging infrastructure to support that," said Assemblymember Jesse Gabriel, a Democrat from Encino who introduced a package of unsuccessful bills last year aimed at expanding access to car chargers.

"We are way behind where we need to be," Gabriel told CalMatters.

Big obstacles stand in the way of amping up the pace of new charging stations in public places. California will need billions of dollars in state, federal and private investments, streamlined city and county permitting processes, major power grid upgrades and accelerated efforts by utilities to connect chargers to the grid.

State officials also are tasked with ensuring that charging stations are available statewide, in rural and less-affluent areas where private companies are reluctant to invest, and that they are reliable and functioning whenever drivers pull up.

In Pacific Gas & Electric's vast service area, home to 40% of all Californians, electric car purchases are moving twice as fast as the buildout of charging stations, said Lydia Krefta, the utility's director of clean energy transportation. Californians now own more than 1.5 million battery-powered cars.

Patty Monahan, who's on the Energy Commission, the state agency responsible for funding and guiding the ramp-up, told CalMatters that she is confident that California can build the chargers its residents need in time.

The agency’s estimate of the current chargers is likely an undercount, she said. In addition, fast-charging stations could play a bigger role than initially projected, meaning hundreds of thousands of fewer chargers might be needed. Also, as the ranges and charging speeds on cars improve, there may be less demand for public chargers.

“California has a history of defying the odds,” Monahan said. “We have a history of advancing clean cars, clean energy, writ-large. We have naysayers left and right saying you can’t do it, and then we do it.”

Barriers to private investments: an uncertain market

On a September day last year, Monahan spoke behind a podium in the parking lot of a Bay Area grocery store. A row of newly constructed car chargers rose behind her.

“Let’s celebrate for a moment,” she said.

California had met its goal of 10,000 fast electric chargers statewide — two years ahead of a target set in 2018.

Fast chargers like the new ones at the grocery store are increasingly seen as critical to meeting the needs of drivers. They can power a car to 80% in 20 minutes to an hour, while the typical charger in use today, a slower Level 2, takes from four to 10 hours.

But installing and operating fast chargers is an expensive business — one that doesn’t easily turn a profit.

Nationwide each fast charger can cost up to $117,000, according to a 2023 study. And in California, it could be even more — between $122,000 and $440,000 each, according to a separate study, although the Energy Commission said the range was $110,000 to $125,000 for one of its programs.

Most of America’s publicly traded charger companies have been forced to seek more financing, lay off workers and slow their network build outs, analysts said. EVgo, for instance, has seen its share price crater, as has ChargePoint, which specializes in selling the slower, Level 2 hardware.

California stands apart from other states — it has by far the most chargers and electric car sales, and more incentives and policies encouraging them.

Tesla, America’s top-selling electric car manufacturer, dominates fast-charging in both California and the U.S. — but the company didn’t get into the business to sell charges to drivers; it got into the charger business to sell its electric cars. Initially Tesla Superchargers were exclusive to its drivers, but starting this year other EV drivers can use them after Tesla provided ports to Ford and other automakers.

Tesla’s manufacturing prowess, supply chain dominance and decade-plus of experience with fast chargers have given it an edge over competitors — a coterie of unprofitable, publicly traded startups, as well as private companies that often benefit from public subsidies, according to analysts.

“All the automakers joined forces with their biggest competitor,” said Loren McDonald, chief executive of the consulting firm EVAdoption. “If that doesn’t tell you how bad fast-charging networks and infrastructure were, I don’t know what else does.”

Now Tesla is showing uncertainty about the future of its charging business amid slumping car sales, and eliminated nearly its entire 500-member Supercharger team in April. Then chief executive Elon Musk said in May that he would spend $500 million to expand the network and hired back some fired workers.

In California, Electrify America, a privately held company, was created by Volkswagen as a settlement for cheating on emissions tests for its gas-powered cars. The company is spending $800 million on California chargers, building a robust network of 260 stations, with more than half in low-income communities, including the state’s worst charging desert, Imperial County.

The problem is Electrify America was ranked dead last in a consumer survey last year, and its chargers have been plagued by reliability problems and customer complaints. The California Air Resources Board in January directed Electrify America to “strive to achieve charger reliability consistent with the state of the industry.” A company spokesperson said the dissatisfaction showed “an industry in its growth trajectory.” There are signs of improvement, based on consumer data from the first three months of this year.

Startups continue to jump into the charging business, with the number of companies offering fast chargers growing from 14 in 2020 to 41 in 2024, EVAdoption said. Seven carmakers formed a $1 billion venture to build a 30,000-charger network in North America. And gas stations such as Circle K are offering more charging because electric car customers spend more time shopping while waiting for their rides to juice up.

But the realization that charging is a costly business has set in on Wall Street, and that doesn’t seem likely to change anytime soon. “Can public EV fast-charging stations be profitable in the United States?” the consultancy McKinsey & Company asked.

“The fervor, the excitement from the investor base, has definitely dwindled quite a bit, given the prospects that EV adoption in the U.S. is going to be slower, revenue growth is really slower, the path to profitability is going to be slower, and they might need more capital than everyone originally expected,” said Christopher Dendrinos, a financial analyst who covers electric car charging companies for the investment bank RBC Capital Markets.

The stakes are high for California when it comes to encouraging investments in expensive fast chargers: If 63,000 additional ones were built, California might need 402,000 fewer slower Level 2 chargers in 2030, according to an alternative forecast by the Energy Commission.

Billions of public dollars: Will it be enough?

Nationwide $53 billion to $127 billion in private investments and public funding is needed by 2030 to build chargers for about 33 million electric cars, according to a federal estimate. Of that, about half would be for public chargers.

Congress and the Biden administration have set aside $5 billion for a national network of fast chargers. So far only 33 in eight locations have been built, but more than 14,000 others are in the works, according to the Federal Highway Administration. California’s share of the federal money totals $384 million; about 500 fast chargers will be built with an initial $40.5 million, said Energy Commission spokesperson Lindsay Buckley.

In addition, the state has spent $584 million to build more than 33,000 electric car chargers through its Clean Transportation Program, funded by fees drivers pay when they register cars. The Legislature extended that program for an additional decade last year.

Newsom has committed to spending $1 billion through 2028 on chargers with his “California Climate Commitment,” Buckley said. But this year Newsom and the Legislature trimmed $167 million from the charger budget as the state faces a record deficit. A lobbyist for the Electric Vehicle Charging Association said “the state pullback sends a very challenging message” to the industry.
