Note for IT: "AJG Tracker" (the office press-clippings tracker)

What it is: a folder that shows Assemblymember Jesse Gabriel's press-coverage database (an Excel workbook of public news clippings, plus a library of saved public news articles) as a page in Edge. It is the full version of the "AJG Tracker test" IT already approved, and works the same way.

What is in the folder:

- `python\`: CPython 3.13.16 for Windows, the official Python Software Foundation build from its NuGet package "python". The `python.exe` and its DLLs carry the PSF Authenticode signature.
- `app\site-packages\`: 10 packages from the official Python package index (PyPI), each checked against a pinned sha256:
- openpyxl, et_xmlfile, beautifulsoup4, soupsieve, typing_extensions, pypdf, python-dateutil, tzdata, pandas, numpy;
- pandas and numpy contain compiled code (.pyd/.dll files built by those projects; not Authenticode-signed);
- everything else is plain Python text.
- `app\`: the tracker's own programs, as readable Python and JavaScript text.
- `data\site\fonts\`: the page's two typefaces, bundled so the page never contacts a font service: Roboto Slab (Apache 2.0) and Public Sans (SIL Open Font License 1.1), with their licence files.
- `data\`: the workbook, the article library, backups and the tracker's notes, all as ordinary files.
- `Start Tracker.cmd`: a short batch file that starts `python\python.exe` on `app\station\launcher.py`.

What it does:

- Listens on 127.0.0.1 port 8765 (this computer only) and opens the tracker page in Edge.
- Reads and writes only inside its own folder, plus files the user picks: an update file or a refresh file, both plain data (JSON and saved article pages; it refuses any file that contains programs).
- Once, at set-up, it reads (never writes, moves or deletes) a folder the user names: a copy of the office's article library and workbook, checked file by file against a fingerprint list, and copies it into its own folder.
- After a save, when a story's Story ID or its Original/Reprint role changed, the saved files of those rows are renamed to match, inside `data\library\` only, after a backup copy of the workbook in `data\backups\` and a cell-by-cell check of the result (the old and new names are listed in `data\state\`). Nothing is deleted.
- It deletes nothing outside its own folder.
- Writes the workbook only after backing it up and checking it, one person at a time.

Network:

- The program itself makes **no** internet or network connections.
- **One exception, by design:** saved articles added from now on show their photos by linking to the news site's own image address. When someone opens such an article in the tracker, Edge loads those pictures from the news site, the same as ordinary web browsing. No other data leaves the computer, and the request carries no referrer. Older saved articles have their photos built in and load nothing.

The Update station (a web page, separate from the program): new stories are found with a private web page on claude.ai, used in the browser like any other website. claude.ai shows such pages from addresses under `claudeusercontent.com`. On the office PCs that address does not resolve (the browser says the server's IP address could not be found), while it works on other computers on the same Wi-Fi. To use the station on an office PC, please allow `claude.ai` and `*.claudeusercontent.com`. The tracker program itself needs neither.

What it does not do:

- Install anything, or need admin rights.
- Touch the registry.
- Create services, scheduled tasks or startup entries.
- Use PowerShell.
- Send any data anywhere.

Installing a newer version: the person unzips the new zip in another folder and runs `Install update.cmd` there. It uses only the new folder's own `python\python.exe` and copies files on the same computer into the existing tracker folder (replacing `app\`, `python\` and the start files, and keeping the old ones in `_previous_version\`); it never touches `data\`. It makes no network connection except a check that nothing is already listening on 127.0.0.1 port 8765. Nothing else is new for IT: the same folder, the same files, no installs.

To remove it: close its window and delete the folder.

Source: full source, build scripts and checksums are available on request.

Fingerprint: SHA-256 of the delivered zip `AJG_Tracker_windows_v4.3.zip` (132.2 MB):
